

How to Write an Abstract

An abstract has to be really crisp and precise. It is the first thing that a reader or evaluator comes across and it forms the basis for the decision of whether to read the entire report or not. If the abstract fails to have the impact that it should have, there are chances that even a worthy manuscript will be rejected. The abstract must contain the objective of research, the question to be answered, methodology that will be adopted, statistical tools to be used, and the method of interpretation of results. It must also state the significance of the study and its need. Though it is difficult to assimilate all this information in a few words, it is necessary and must be done with caution.
